COMP019 Project Specifications & Guidelines

Author: Steven Villarosa

Project Specification

- An Angular application that is deployed, functional, dynamic, and hosted over the internet.
- Must demonstrate CRUD operations (Create, Read, Update, Delete)
- Should include user authentication (login/logout, role-based access if possible)
- Responsive design (must work on desktop & mobile views)
- API Integration from external system is a plus but not required.
- We'll practice [API-first](#) development approach, [headless](#) architecture.
- You can use any third-party tools and library compatible with Angular(Bootstrap, Tailwind, Composer, JQuery, Github Actions, PrimeNG, Laravel, CodeIgniter, etc.).

Project Proposal Document

- Submission/Revision Period: Aug 29-Sep 5, 2026
- Upload the document into your repository in directory called "document" with file name "Groupname - Project Proposal.pdf" using pull request.
- Content Outline:
 - Project Title – clear and descriptive.
 - Problem Statement – briefly explain the issue
 - Objectives – general and specific goals of the project.
 - Proposed Solution – a short description of the system/application to be developed, highlight core functionalities only, and expected users.

Note: Keep your proposal short(Max of 300 words) and use simple language.

Make sure that your proposal has been approved before you begin with your project. Assign your instructor as the reviewer for the pull request. I will approve the PR once the proposal is good enough. Please notify/follow-up if necessary.

Project Repo

- You will be provided a Github repo for this project. You will only use that repository.
- All resources related to the project should be uploaded in your repository.

Project Directory

- documents - project management related docs, sprint plan, retro docs, etc. Create subfolder for each sprint.
- frontend - Angular files
- backend - Whatever back-end files you're using
- README.md - should contain general project details, sample user credentials, etc.

Web Host

- Your web host should be ready by October 17, 2026 11:59PM. Update your README file in your project repo and add your host URL.

Development Workflow(Github Flow)

Follow this development workflow process:

- Commits should not be pushed directly into the main branch.
- All changes are required to undergo pull request and code reviews.
- Your codes should follow our coding standard and best development practices in the industry.
- Protect your main branch so that it will required at least 1 code reviewer's approval to merge a pull request.

Roles

These are some roles I'm expecting you to have into your project:

- Project Manager/Developer
 - In charge of project timelines
 - should be able to track the progress based on the initial timeline
 - should provide the progress in percentage of completion
 - should tell which features are implemented and under development
 - should delegate tasks to each members in coordination with technical lead
- Tester/Developer
 - should provide a test matrix
 - the tester will be held accountable for every bug found in the production environment

Roles

- Technical Lead/Developer
 - should be in charge of the overall system design including
 - database design
 - application architecture
 - should work well with Project Manager to determine which tasks can be done in parallel and which tasks are linear.
- UI/UX Designer/Developer
 - should develop mock ups
 - should design the look and feel of the app
 - should design the web component's layout and its behavior

Reminder

I understand that you have different strength and that is the basis of your role assignment. However, this is still a programming subject and I'm expecting you to take part in coding. You can take dual roles such as mentioned in the previous slides. If all roles are taken, you can just be a developer whose focus is on coding.

How you will be graded?

As a team

- all required features are implemented.
- all components are working correctly.
- the overall user experience of the system.

Individually

- By your contribution in codes
 - By checking your commits in github, I can tell whether your codes are significant or not.
- By your contribution depending on your role.
- By your teammates feedback at the end of this project.

Activities

We will use Agile/Scrum methodology for this project. We will have the following activities:

- Stand up meeting
 - each member should provide an update about their tasks in front of the class.

For Project Managers

- Use [Notion](#) as a tool for your project management.
- Sprint Planning/Progress Update
 - discuss which tasks are completed in the sprint and which tasks are carried over to the next sprint.
 - list down the list of tasks and assignments that will be included in the next sprint.
- Sprint Retrospective
 - what went well - discuss your current progress and milestones.
 - what could be improved - discuss any roadblocks and problems you encountered.
 - what needs to be done - discuss your next action items and remaining tasks.

Sprint Ceremony Document

- For your Sprint Planning /Progress Update, and Sprint Retrospective, write it into a PDF document and upload it into your github repository inside the "document" directory. File organization is up to you. It doesn't have to be 2 page essay. Keep it simple, short, and precise. The first thing I will look for is your current percentage of completion. Upload these documents before our weekly meeting. The project manager will discuss it in our class.

Schedule of Activities

Date	Week No.	Deliverable
Sep-5-2026	Week 4	Project Proposal
Sep-12-2026	Week 5	Project Proposal
Sep-19-2026	Week 6	User Story/Usecase/WBS /Timeline Presentation
Sep-26-2026	Week 7	User Story/Usecase/WBS /Timeline Presentation
Oct-3-2026	Week 8	UI/UX Mockup
Oct-10-2026	Week 9	API specification document
Oct-17-2026	Week 10	Midterm Exam
Oct-24-2026	Week 11	Sprint 1
Oct-31-2026	Week 12	Sprint 2
Nov-7-2026	Week 13	Sprint 3 - Holiday
Nov-14-2026	Week 14	Sprint 4
Nov-21-2026	Week 15	Sprint 5
Nov-28-2026	Week 16	Project Completion
Dec-5-2026	Week 17	Project Presentation

Project Score

Criteria	Percentage
UI/UX	35
Functionality and Completeness	35
Team Collaboration	20
Architecture	10
Total	100

User Interface - 35%

- The user can easily understand how to use and navigate the application through the following:
 - consistent look and feel
 - efficient page layout(responsive/fluid)
 - logical orders/grouping of components
- The user can predict the next steps/actions based on the application's behavior(labels, notification, validation, progress indicator, prompts, alerts, etc).

Functionality and Completeness - 35%

- The application has significant features that are reasonable based on the timeline.
- The application has satisfied its purpose.
- The application works smoothly and without errors as expected.

Team Collaboration - 20%

- Every member has a significant contribution to the project based on his/her role.
- The tasks are distributed properly based on the member's role.
- There is a clear communication, process, and workflow.
- All members are well-coordinated and compliant to the process/timeline.

Architecture - 10%

- The team has a clear understanding of the different tech stack used in their application(front-end, backend, testing/automation tools, and CI/CD) and how these components integrate with each other and/or externally.
- The team has utilized different design patterns and data structures to optimize the application's performance.
- The codebase followed the best coding practices and techniques to make a clean and readable codebase.

Individual Performance

- During the project presentation, the you will be assessed individually.
- After the presentation, you will assess your groupmate including yourself.
- Your individual performance score will be based from:
 - individual scores from the project assessment
 - scores given to you by your groupmates
 - assessment from your instructor

Project Sprint Participation

- During the project development, we will conduct sprint ceremony.
- You will be graded every in sprint depending on your contribution.
- You can check your accumulated score in this [spreadsheet](#)

Escalations/Concerns

- We are all grown ups so let's act accordingly.
- However, we still have our differences so conflict may rise. However, let's structure our escalation process so to address only the important cases.
- Respect your leaders!
 - If you have problems within your group, the leaders should be aware of it and should address the issue. Don't communicate to the teacher directly unless you have talked with your leader about it. I expect that you have already tried to reconcile it within your group.
- If the conflict is irreconcilable, then raise the concern to the teacher.
