Coding Guidelines and Best Practices

Author: Steven Villarosa

General Guidelines

- Name variables properly.
 - Use descriptive variable names: what they contain
 - Use descriptive function names: what they do
- Keep your directories and files neat and organized.
 - Follow language/framework directory structure
 - Observe proper and consistent spacing.
 - Remove unnecessary lines and spacing.
 - Remove unnecessary files in the repo.
 - 99.99% of codes for the future are not used in the future.

General Guidelines

- If you need to add something that needs to be done, add a TODO comment with the format:
`<!-- TODO(Lastname, Givenname): What needs to be done -->` - For HTML
`// TODO(Lastname, Givenname): What needs to be done` - For TS and JS
- Remove dead and unnecessary codes.
- Avoid magic values, use constant values instead.
- For boolean variables and functions, make the name answerable by yes or no.
 - Ex. isValid, hasProperty, isOnline()
- **Review your codes first** before asking others to review your work.

Why do we have to follow guidelines?

READABILITY!!!

We value collaboration over competition!

Collaboration

Competition

Scripture Reading

"As iron sharpens iron, so one person
sharpens another."

- Proverbs 27:17
